Community-Based Research Solutions for Clinical Trials

At PCM Trials and EmVenio Research, a PCM Trials company, our mission is to make clinical research more inclusive and equitable by bringing clinical trials directly to participants—in their homes, workplaces, and communities. With a flexible, community-based approach, we prioritize optionality and accessibility, helping sponsors maximize trial diversity, engagement, and retention across therapeutic areas.

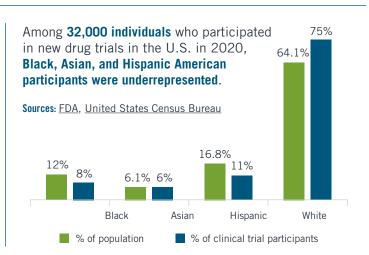

80%

Did you know that around 80% of global studies fail to recruit and retain enough trial participants to meet enrollment timelines?

70% of potential clinical trial participants live more than two hours from the nearest study center.

What is community research?

Community research bridges the gap between clinical trials and the communities they serve, bringing research directly into diverse neighborhoods and underrepresented populations through a multi-faceted strategy.

Mobile community-based sites are designed to go where participants are. Equipped with the resources and staffing needed to conduct high-quality trials and collect data on-site, our network of community sites brings clinical trial opportunities directly into local communities, improving clinical trial access for underrepresented populations.

VIRTUAL VISITS

Virtual visits offer participants the flexibility to participate in certain aspects of trials from the comfort of their own homes, reducing travel burdens and making it easier to stay engaged.

Mobile visits bring clinical trials activities directly to participants. Our extensive network of expertly trained mobile clinicians perform study protocols at a participant's home or a location of their choosing, such as their workplace, school or hotel.

COMMUNITY HEALTH CENTERS Community health centers integrate clinical research into existing community health centers, creating opportunities for engagement and education around trials, all while enrolling participants where they feel most comfortable. Through a strategic alliance with Prime Healthcare, EmVenio Research sites are now embedded within pre-existing health centers nationwide.

Community-Based Research Solutions for Clinical Trials

Increase recruitment of underrepresented populations

Expand the geographic reach of clinical research

Reduce patient burden with patient-centric options

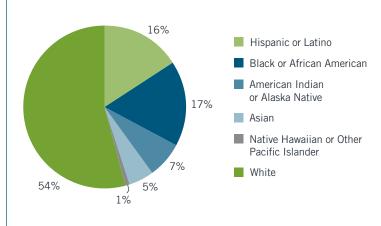

Reach faster results with increased patient retention

41%

Trials that utilize mobile visits are 41% more likely to finish on time than similar trials without.
